**THE president of the Australian Medical Association, Dr Steve Hambleton, reckons it should be more difficult for unvaccinated children to enrol in primary school.**

This is ridiculous.

There should be completely separate schools for unvaccinated children.

Schools with high walls through which no sensible information can penetrate.

It seems logical that the kiddies with measles, or who will inevitably get measles, should all be corralled in the same spot. Away from the kids who have been immunised against measles and other potentially deadly ills.

**SIGN OUR PETITION - NO JAB, NO PLAY** (<http://www.dailytelegraph.com.au/news/time-to-stop-keeping-kids-immune-from-jab/story-e6freuy9-1226635389528>)

Away from folks who like their medical information delivered after peer-reviewed, oft-repeated studies, rather than from unproven, sometimes even disproven, theories.

Away from people with polio. Except there aren't any. Vaccination sorted that bugger out more than a decade ago.

Mind you, a primary school full of unvaccinated kids would need to do a few things differently to normal schools.

They could have a hospital on site to look after the little 'uns who get sick and then pass it on to their school buddies, to save on time away from school. There could even be themed wards - one for kids with weeping blisters, one for those coughing like the open gates of hell, and one mini hospice for kids who get so sick that they die.

For those children that remain healthy, there could be an adjusted curriculum.

Geography lessons could present a "balanced" range of theories, including the one that says Earth is flat, and the one that says that the sun revolves around it. Because the theory that Earth is round is just one side of the story, you see. Science classes could be greatly simplified, leaping straight

from a theory to a conclusion without the messy and time-consuming need for experiments and that "scientific method" piffle.

As long as you can get something that looks like correlation and a handful of testimonials from people who reckon your theory sounds about right, you're set.

Story time would come in two parts, to show that there are two sides to everything.

There's non-fiction, obviously peddled by worldwide conspirators, and then there's fiction, which can be used to inform choices you make about your health.

The alphabet is easier in Unvaccinated Primary, too. It goes A, B, C, D, E, Riboflavin and Niacin, because vitamins are all you need to be healthy and well edacat ... edukat ... smart. Children graduating from schools for the unvaccinated should be kept isolated from the real world for as long as possible. There are facts out there, which could come as a shock to their frail systems. Establishing such schools would not be cheap; there'd be no state or federal funding, most likely because worldwide governments are in the pocket of Big Pharma.

Luckily, the usually high socio-economic groups that have the time to read information spread by dangerous halfwits on the internet can probably afford the extra school fees.

Alternatively, people could just stop listening to rubbish and get their kids vaccinated.
